ABSTRACT

A process that achieves a striping or pin-striping or other specified pattern decoration on molded surfaces during manufacturing. This process begins by engraving the stripe or other pattern into the surface of the initial sculpted figurine in the specified area. The stripe engraving or other pattern can be as thick or thin as desired but typically between .25mm to .5mm thick and between .1mm to 1mm deep below the surface. The stripe pattern is engraved on the surface of the original model master figurine when the figurine is initially sculpted.
